ASSIGNMENT 6B REFLECTION

One issue that I encountered while making my site was the design of my radio buttons for the selection of the glaze and quantity. I had designed the selections as buttons, so I had to look for a way to allow for the user to select an option with them. Therefore, I had to change them to radio buttons, which affected the initial design. I also had a bit of an issue with flexbox for my cart page for assignment 6b. It was hard to replicate the positioning of the items on the cart page with css flexbox, so I had to change the positioning to a column, instead of rows (as it was on the high-fidelity prototype). The page also had to change in response to the user's needs/choices, so I couldn't have static html and had to write some HTML in javascript because I needed the cart page to update (and delete an item when the user chose to).

ASSIGNMENT 6B REFLECTION

Two concepts that I learned and incorporated into my coding for this assignment was the storing and retrieving of objects. I used it to store an array of the product order that would then be retrieved when the user went to the cart to see their order. I also utilized the making of new objects and object constructors to make the product array and store it as well. The 'getElementById' is a method that I used often for this homework assignment, because it allowed me to easily change the html of a particular section (for example, the price of the cinnamon buns. I found that as I was doing the assignments, each of these concepts (in addition to others) were connected to one another, which made learning them easy.
