ASSIGNMENT 6 REFLECTION

For my low fidelity mockup of the Cart page, I wanted the user to have the freedom to change options when they needed to, so I provided a 'remove item' link in case they wanted to get rid of the item, dropdown menus, as well as a continue shopping button (that takes them back to the menu page) in case they wanted to add some more items to their cart.
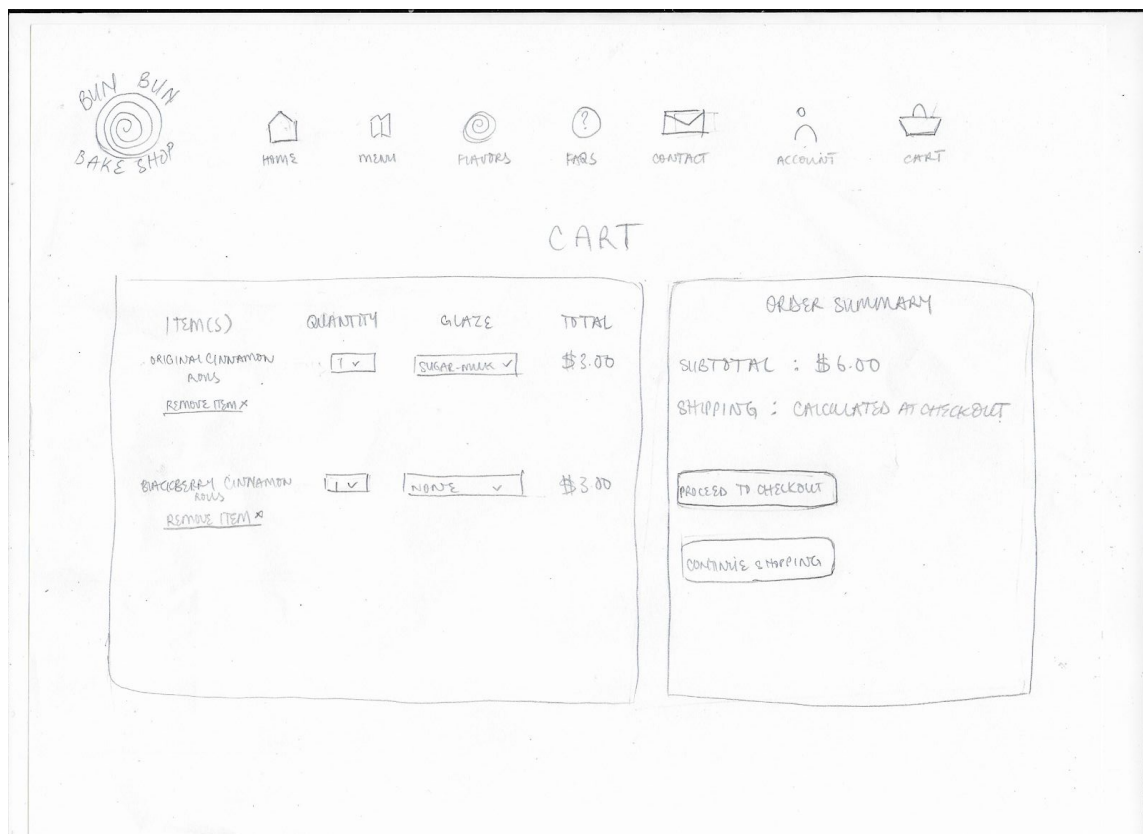

I separated the order section from the order summary section because I thought that this organization would make it easier on the eyes for the user. One section is to make changes to their order and the other is for when they are ready to checkout.

In the high fidelity mockup, however, I aimed for a simpler design that fit the theme and aesthetic of the Bun Bun Bake Shop website. The order information is centered in the page and the subtotal section is below it.
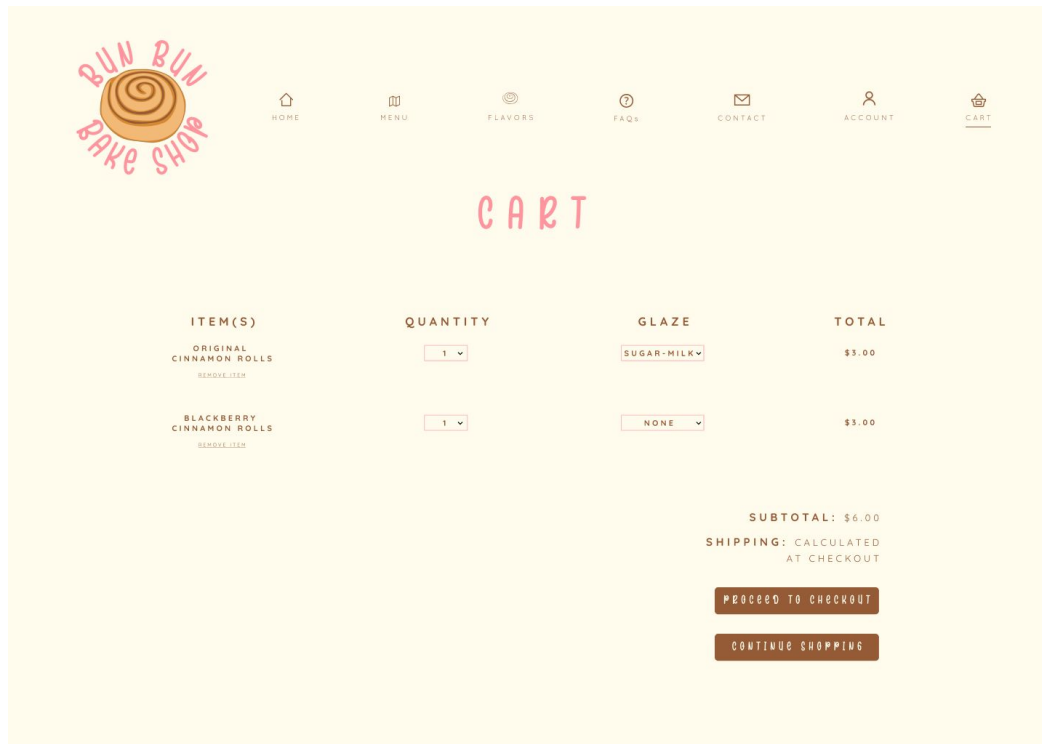

This new high fidelity page is different from my previous one in that I added a section for the total price of each item and also rearranged the order of the elements on the page (with the subtotal section being on the bottom). I chose this placement for the subtotal section because most websites put this section below the order information, and so the user's eyes have a high chance of being drawn to that area. The buttons are a 'call to action' and so I made them a different color with more contrast to the page. Another element on the page that allows for ease-of-use is the dropdown menus for the quantity and glaze options so that the user can change options on the cart page without having to go back to the item detail page. This feature and the others offer flexibility to the user and makes for a good user experience on the site.
